

Advantage

Project Profile

Advantage EC-1 Reduces Cationic Polymer 47%

Poultry Processor in Dobson NC agreed to an Advantage trial in mid April. Two Advantage Induction Plates were placed on the floc tube and driven by the briefcase demo unit. Within 30 minutes the online turbidity dropped and Cationic Polymer was reduced 30% to match the original turbidity. A permanent driver panel was connected and within 3 days Cationic Polymer reduction was reported to be 50%. Following 30 days of continuous treatment the system remains stable and the Poultry Processor reports a 47% savings.
